**5.)Question:** The probability that a bulb produced by a factory will fuse after 150 days of use is 0.05. Find the probability that out of 5 such bulbs

- 1) none
- 2) not more than one
- 3) more than one
- 4) at least one

will fuse after 150 days of use.

**Solution:** Let the **Probability** of  $i$  bulb to fuse after 150 days of use be  $Pr(i)$ .

Probability of a bulb to fuse after 150 days is  $=0.05$   
Probability of one bulb getting fused is independent of another

Let

$$p = 0.05 \quad (1)$$

$$q = 1 - p = 0.95 \quad (2)$$

Let Cumulative Distributive Function be:

$$F_X(i) = Pr(X \leq i) \quad (3)$$

$$Pr(X = i) = {}^5C_i p^i q^{5-i} \quad (4)$$

$$\therefore F_X(i) = \sum_{r=0}^i {}^5C_r p^r q^{5-r} \quad (5)$$

$$F_X(0) = 0.95^5 = 0.7737809375 \quad (6)$$

$$F_X(1) = (0.95)^5 + {}^5C_1 \times (0.5) \times (0.95)^4 \quad (7)$$

$$F_X(2) = (0.95)^5 + {}^5C_1 \times (0.5) \times (0.95)^4 \quad (8)$$

$$+ {}^5C_2 \times (0.5)^2 \times (0.95)^3 \quad (9)$$

$$F_X(6) = 1 \quad (10)$$

1) Probability that none of the 5 bulbs fuses is:

$$Pr(0) = F_X(0) \quad (11)$$

form (11)

$$= 0.95^5 \quad (12)$$

$$= 0.7737809375 \quad (13)$$

2) Probability that not more than one bulb fuses is same as exactly 0 bulb fuses or exactly one bulb fuses:

$$Pr(0) + Pr(1) = F_X(1) = 0.9774075 \quad (14)$$

3) Let A be event that none of the bulbs is fused and B be event that exactly one bulb is fused  
Probability that more than one bulb will fuse will be:

$$\sum_{i=2}^6 Pr(i) = F_X(6) - F_X(1) \quad (15)$$

form (15)

$$= 0.0225925 \quad (16)$$

4) Probability that at least one bulb is fused is

$$\sum_{i=1}^6 Pr(i) \quad (17)$$

$$= F_X(6) - F_X(0) \quad (18)$$

form (17)

$$= 1 - (0.95)^5 = 0.2262190625 \quad (19)$$
